Address
Dar es Salaam, Tanzania

Expertise

Backend: Actix Web,

Elysia, Node/Bun

Frontend: Next.js,

Dioxus, React Native

Databases:

PostgreSQL, MySQL

DevOps: CI/CD,

Scheduling,

Monitoring

Architecture: RBAC,

Multi-tenant system

Language

Swahili

English

Summary

Backend & Infrastructure Engineer specializing in scalable system design, automation platforms, and multi-tenant architectures. Experienced in building and operating production backend systems with a focus on reliability, performance optimization, and developer productivity. Strong in designing automation tools, managing deployments, and improving system efficiency in real-world environments.

Experience

2022 – 2024

Fusiontech

Fullstack Developer (Backend-Focused)

Built internal tools to improve developer workflows and reduce repetitive tasks, with a focus on backend utilities and API integrations. Supported frontend teams through backend services and contributed to improving system maintainability and development efficiency.

2024 - Present

Thebridge Tech creative

Fullstack Developer (Backend-Focused)

Developed backend systems and automation tools used in production environments, including a self-service database backup platform adopted internally to improve reliability and reduce manual operations. Contributed to CI/CD pipeline improvements, backend integrations, and system deployment workflows.

Projects

2025 - Present

erp.aimsoftwares.com

ERP System – Leave Management Module

Designed and deployed a multi-tenant backend system with scoped RBAC, audit-ready workflows, and complex accrual and approval logic. Optimized database performance using indexing and query tuning, and managed VPS deployment, CI/CD, and system reliability. Also developed the frontend interface to support user workflows and administrative operations.

2025 - 2025

Automated DB Backups, Monitoring & Recovery (Contabo + Slack)

Architected a backend automation platform with dynamic scheduling, retention policies, and role-based access control. Implemented S3-compatible storage, asynchronous processing, and Slack-based alerting, with the system later adopted for production use. Built a lightweight interface for managing backups and monitoring system status.

2025-2025

Kijumbe – Group Contributions & Automated Payouts

Developed backend services for dynamic contribution scheduling, automated payouts, and transactional processing to ensure data consistency. Implemented role-based governance and financial workflows. Built the frontend application to support user interactions and configuration.
